

AMENDMENTS TO THE SPECIFICATION

On page 14 of the Specification please amend lines 5-17 to read:

Next, the outermost layer 11 is described. The outermost layer 11 is intended to protect the moisture proof layer 12 from the external frictions or impacts, and this layer may be made of polyethylene, polypropylene, ~~polyethylenenaphthalate~~ polyethylene naphthalate or the like. However, differently from bags for confectionery handled by many and unspecified consumers, the electrode material 1 is handled by specific and skilled persons, and therefore, external influence is not needed to be severely taken into consideration. In the shown embodiment, the outermost layer 11 is preferably formed of PET (polyethylene-terephthalate), in consideration of the production cost and the productivity as being the most important factors.
